

# PROJECT

**PROJECT NAME: - City Guide System.**

**BAROT BINDIYA ARUNKUMAR.**

COLLAGE NAME:

INSB Inst. OF INFO. TECH. &  
MGT. STD, BCA Collage & ACCHE PGDCA Collage.

# **1. Analysis :-**

In the digital age, city guide websites have become essential tools for both travellers and locals alike. They serve as a comprehensive resource for information about a city's attractions, restaurants, events, and services. In this project, we will introduce a City Guide Website developed using ASP.NET, a popular web development framework, designed to provide users with a rich and interactive experience when exploring a city.

The primary objective of our City Guide Website is to offer a user-friendly and informative platform for individuals seeking to explore the city. Whether you're a tourist visiting for the first time or a resident looking for new experiences, our website aims to be your go-to resource.

1. **Interactive Maps:** Users can access detailed city maps with marked points of interest, making it easy to navigate and plan their trips.
2. **Attractions and Landmarks:** We provide comprehensive information on popular tourist attractions, historical landmarks, and cultural sites.
3. **Restaurant and Dining Guide:** Explore an extensive restaurant directory with user reviews and ratings, helping users make informed dining choices.
4. **User Reviews and Ratings:** Users can contribute by leaving reviews and ratings for places they've visited, enhancing the community-driven aspect of the website.

## **2. Required analysis:-**

### **Technology Stack Selection:**

- Choose the ASP.NET technology stack that best suits your project's requirements. ASP.NET offers options like ASP.NET Web Forms, ASP.NET MVC, or ASP.NET Core.

### **Marketing and Promotion:**

- Develop a marketing strategy to promote your city guide website, including social media marketing, email campaigns, and partnerships with local tourism organizations.

#### **I. New system :**

##### **Development Tools:**

- .NET Framework or .NET Core: Choose the appropriate version of the .NET framework for your project. As of my last update in 2022, .NET Core had evolved into .NET 5 and later .NET 6, with a focus on cross-platform development.

- ASP.NET MVC or ASP.NET Core MVC: Choose the ASP.NET web framework that suits your needs. ASP.NET Core is recommended for modern web applications.

## II. Existing system:

**Operating System:** You can develop an ASP.NET website on Windows, but you can also host it on Linux-based servers if needed.

**ASP.NET Development Tools:** Make sure you have the ASP.NET development tools and libraries installed in your development environment.

**Storage:** Sufficient storage space for your project files, database, and any media assets (images, videos, etc.) associated with your city guide website.

**Memory (RAM):** The amount of RAM you need depends on the complexity of your application. At a minimum, 4GB of RAM is recommended for a development machine, but more RAM may be necessary for larger projects.

## III. Problem statement :

- **Lack of Comprehensive Local Information:** Many tourists and even residents struggle to find up-to-date and reliable information about local attractions, restaurants, events, and services in the city.
- **Information Overload:** The abundance of online information can be overwhelming. Users need a curated and user-friendly platform to find relevant information efficiently.

## 3. Feasibility study:-

### i. Require feasibility :

Creating a city guide website using ASP.NET, like any other project, requires a feasibility study to determine whether the project is viable and worth pursuing.

### ii. Financial Feasibility:

Estimate the project's budget, including development costs, server/hosting expenses, marketing, and ongoing operational expenses.

Determine potential revenue streams, such as advertising, premium features, or partnerships.

Calculate the expected return on investment (ROI) and payback period.

### iii. Resource Feasibility:

**Software:**

**ASP.NET Framework:** You'll need the ASP.NET framework to develop your website.

Database Management System: Choose a database system (e.g., Microsoft SQL Server, MySQL, PostgreSQL) to store and manage data, such as city information, user profiles, and content.

**Integrated Development Environment (IDE):** Software like Visual Studio can be used to develop and debug your ASP.NET application.

## **4. Tools and technology :**

### **1. Development Environment:**

- **Visual Studio:** Microsoft Visual Studio is the integrated development environment (IDE) of choice for ASP.NET development. It offers a range of features to streamline web development.

### **2. Front-End Development:**

- **HTML, CSS, and JavaScript:** These are the fundamental technologies for building the front end of your website.
- **ASP.NET Web Forms or ASP.NET MVC:** Choose the appropriate framework for building the web pages and user interfaces.

### **3. Back-End Development:**

- **ASP.NET Core:** ASP.NET Core is a modern, open-source framework for building web applications and APIs. It's highly recommended for new projects.
